Overview

The 515 HC06 application measures the volume, mass and energy content of fluid in a heating or cooling system by using single or stacked differential pressure volumetric flow inputs in conjunction with feed and return temperature inputs.

A selection of fluid types and modes makes it suitable for many heating/cooling applications. The instrument calculates the flow according to generic differential pressure equations and incorporates the conditions at which the flowmeter was calibrated.

The instrument calculates the mass flow and energy according to the IAPWS Industrial Formulation (1997) when the fluid type is water, while internal enthalpy and density tables are used for the selection of other industry fluids.

Calculations

This instrument can calculate the mass and energy for the following common industry fluids:

- Water
- Glycol (35% Solution)
- Brine (27% CaCl₂)
- TYFOXIT F20
- TYFOXIT F40
- Essotherm 500 / Thermaloil
- THERMINOL 55
- User Custom Fluid

Formulas

$$\text{Mass flow} = \text{Volume flow} \times \rho_{\text{flow}}$$

$$\text{Power} = \text{Mass flow} \times (h_{\text{TF}} - h_{\text{TR}})$$

where:

ρ_{flow} = density at flow conditions

h_{TF} = Specific enthalpy at feed temperature

h_{TR} = Specific enthalpy at return temperature

Displayed Information

The front panel display shows the current values of the input variables and the results of the calculations. A list of the variables for this application and their type (total or rate) is shown at the end of this document.

The instrument can be supplied with a real-time clock for data logging of over 1000 entries of the variables as displayed on the main menu.

Communications

There are three communication ports available as follows:

- RS-232 port (standard)
- RS-485 port (advanced option)
- Infra-red port (on front panel)

The ports are available for remote data reading, printouts and for initial application loading of the instrument.

Isolated Outputs

The opto-isolated outputs can re-transmit any main menu variable. The type of output is determined by the nature of the assigned variable. Totals are output as pulses and rates are output as 4-20mA signals. One output is standard, a second output is available as an option.

Relay Outputs

The relay alarms can be assigned to any of the main menu variables of a rate type. The alarms can be fully configured including hysteresis. Two relays are standard with an additional two available in the advanced option.

Software Configuration

The instrument can be further tailored to suit specific application needs including units of measurement, custom tags, second language or access levels. A distributor can configure these requirements before delivery.

Instrument parameters including units of measurement can be programmed in the field, according to the user-access levels assigned to parameters by the distributor.

All set-up parameters, totals and logged data are stored in non-volatile memory with at least 30 years retention.

Temperature Input Types

Temperature sensor inputs can be either PT100, PT500, 4-20mA, 0-5V or 1-5V signals.
